

BIOS 755: Missing Data Wrap-up

Alexander McLain

April 9, 2026

Missing Data: Overview

Two approaches:

- ▶ Likelihood-based (Covariance Pattern Analysis/ LMM / GLMM)
- ▶ GEE-based (standard / weighted)

Key idea: Validity depends on missingness mechanism

Likelihood Methods: MCAR / Covariate

- ▶ **MCAR:**
 - ▶ Valid
 - ▶ Use standard model
- ▶ **Covariate-dependent missingness:**
 - ▶ Valid if covariates (appropriately) included

Likelihood Methods: Baseline / MAR

- ▶ **Missing baseline covariates:**
 - ▶ Must be handled separately (e.g., imputation)
- ▶ **MAR:**
 - ▶ Valid if model correctly specified
 - ▶ Uses all available data
 - ▶ Imputing missing outcomes is more robust to model misspecification

Likelihood Methods: MNAR

- ▶ **MNAR:**
 - ▶ Not valid
 - ▶ Requires sensitivity analysis or alternative models

GEE Methods: MCAR / Covariate

- ▶ **MCAR:**
 - ▶ Standard GEE is valid
- ▶ **Covariate-dependent missingness:**
 - ▶ Valid if covariates included

GEE Methods: Baseline / MAR

- ▶ **Missing baseline covariates:**
 - ▶ Must be handled separately (e.g., weighting)
- ▶ **MAR:**
 - ▶ Standard GEE not valid
 - ▶ Use weighted GEE (IPW)

GEE Methods: MNAR

- ▶ **MNAR:**
 - ▶ Not valid
 - ▶ Requires sensitivity analysis or specialized methods

Key Takeaways

- ▶ Likelihood: valid under MAR (if correctly specified)
- ▶ GEE: needs weights under MAR
- ▶ Baseline covariates missing → handle separately
- ▶ MNAR → no standard solution
