

1. What is the clustering structure?

- What is the observational unit?
- What is the repeated unit?
- Are there higher levels (e.g., clinic, neighborhood)?

2. Would you use:

- Covariance Pattern Model?
- Linear Mixed Model?

Explain why.

3. How can you test the hypothesis of interest?

4. Specify a reasonable mean model.

Write it in equation form. Include:

- Confounders
- Effect modifiers
- What is the best time variable?

5. Give one covariance/random effect you would try out besides compound symmetric/random intercept?

6. What is the primary parameter of interest?

7. One potential modeling challenge?
